Section 13.5 The Binomial Theorem

$$(x+a)^1 = x+a$$

$$(x + a)^2 = x^2 + 2ax + a^2$$

$$(x + a)^3 = x^3 + 3ax^2 + 3a^2x + a^3$$

$$(x + a)^4 = x^4 + 4ax^3 + 6a^2x^2 + 4a^3x + a^4$$

$$(x + a)^n = x^n + \underline{\qquad} ax^{n-1} + \underline{\qquad} a^2x^{n-2} + \cdots + \underline{\qquad} a^{n-1}x + a^n$$

1 Evaluate $\binom{n}{j}$

DEFINITION

If j and n are integers with $0 \le j \le n$, the symbol $\binom{n}{j}$ is defined as

$$\binom{n}{j} = \frac{n!}{j!(n-j)!} \tag{1}$$

EXAMPLE Evaluating $\binom{n}{i}$

Find:

(a)
$$\binom{4}{1} = \frac{4!}{1!(4-1)!} = \frac{4!}{1!3!} = \frac{4 \cdot 3 \cdot 2 \cdot 1}{1(3 \cdot 2 \cdot 1)} = 4$$

(b)
$$\binom{5}{3} = \frac{5!}{3!(5-3)!} = \frac{5!}{3!2!} = \frac{5 \cdot 4 \cdot 3 \cdot 2 \cdot 1}{3 \cdot 2 \cdot 1(2 \cdot 1)} = 10$$

(c)
$$\binom{7}{5} = \frac{7!}{5!(7-5)!} = \frac{7!}{5!2!} = \frac{7 \cdot 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1}{5 \cdot 4 \cdot 3 \cdot 2 \cdot 1(2 \cdot 1)} = 21$$

(c)
$$\binom{7}{5} = \frac{7!}{5!(7-5)!} = \frac{7!}{5!2!} = \frac{7 \cdot 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1}{5 \cdot 4 \cdot 3 \cdot 2 \cdot 1(2 \cdot 1)} = 21$$

(d)
$$\binom{50}{35} = \frac{50!}{35!(50-35)!} = \frac{50!}{35!15!}$$
 Use a calculator.

 $\binom{n}{i} = \frac{n!}{i!(n-j)!}$

Four Useful Formulas

$$\binom{n}{0} = 1 \qquad \binom{n}{1} = n \qquad \binom{n}{n-1} = n \qquad \binom{n}{n} = 1$$

Pascal triangle

$$n = 5 \rightarrow$$
 1 5 10 10 5 1
 $n = 6 \rightarrow$ 1 6 15 20 15 6

2 Use the Binomial Theorem

Binomial Theorem

Let x and a be real numbers. For any positive integer n, we have

$$(x + a)^n = \binom{n}{0} x^n + \binom{n}{1} a x^{n-1} + \dots + \binom{n}{j} a^j x^{n-j} + \dots + \binom{n}{n} a^n$$
$$= \sum_{j=0}^n \binom{n}{j} x^{n-j} a^j$$
(2)

EXAMPLE Expanding a Binomial

Use the Binomial Theorem to expand $(3y+2)^4$

$$= {4 \choose 0} (3y)^4 + {4 \choose 1} (2) (3y)^3 + {4 \choose 2} (2)^2 (3y)^2 + {4 \choose 3} (2)^3 (3y) + {4 \choose 4} (2)^4$$

$$= 81y^{4} + 4(2)(27y^{3}) + 6(4)(9y^{2}) + 4(8)(3y) + 16$$

$$=81y^4 + 216y^3 + 216y^2 + 96y + 16$$

$$(x+a)^n = \binom{n}{0}x^n + \binom{n}{1}ax^{n-1} + \dots + \binom{n}{j}a^jx^{n-j} + \dots + \binom{n}{n}a^n$$

EXAMPLE

Finding a Particular Coefficient in a Binomial Expansion

Find the coefficient of x^7 in the expansion of $(3x-1)^{10}$

The
$$x^7$$
 term would be $\binom{10}{3} (3x)^7 (-1)^3 = \frac{10!}{3!7!} (2187x^7)(-1)$

$$= \frac{10 \cdot 9 \cdot 8 \cdot 7!}{6 \cdot 7!} (2187x^7) (-1) = -262,440x^7$$

Based on the expansion of $(x + a)^n$, the term containing x^j is

$$\binom{n}{n-j}a^{n-j}x^j$$

EXAMPLE

Finding a Particular Term in a Binomial Expansion

Find the seventh term in the expansion of $(y+3)^8$

The 7th term would be
$$\binom{8}{6}(y)^2(3)^6 = \frac{8!}{6!2!}(y^2)(3)^6$$

$$= \frac{8 \cdot 7 \cdot 6!}{6!2!} (729y^2) = 28(729y^2) = 20,412y^2$$

Based on the expansion of $(x + a)^n$, the term containing x^j is

$$\binom{n}{n-j}a^{n-j}x^j$$

THEOREM

If *n* and *j* are integers with $1 \le j \le n$, then

$$\binom{n}{j-1} + \binom{n}{j} = \binom{n+1}{j} \tag{4}$$

EXAMPLE Expanding a Binomial

Use the Binomial Theorem to expand $(x-3)^6$

$$= \binom{6}{0}x^{6} + \binom{6}{1}(-3)x^{5} + \binom{6}{2}(-3)^{2}x^{4} + \binom{6}{3}(-3)^{3}x^{3} + \binom{6}{4}(-3)^{4}x^{2} + \binom{6}{5}(-3)^{5}x + \binom{6}{6}(-3)^{6}$$

$$= x^{6} + 6 \cdot (-3)x^{5} + 15(9)x^{4} + 20(-27)x^{3} + 15(81)x^{2} + 6(-243)x + 729$$

$$= x^{6} - 18x^{5} + 135x^{4} - 540x^{3} + 1215x^{2} - 1458x + 729$$

$$(x+a)^n = \binom{n}{0}x^n + \binom{n}{1}ax^{n-1} + \dots + \binom{n}{j}a^jx^{n-j} + \dots + \binom{n}{n}a^n$$
